

Data Science Project: Endsem Presentation

Endsem project evaluation will be based on scaling techniques used before training your model (i.e., a preprocessing steps) and/or during training. Any of the group members can submit it in the classroom by 1159 pm on 10/12/25. The file name must follow the same naming convention as used in the midsem.

Your presentation must cover the following aspects.

1. Which training model is used to solve your problem statement? Describe the running time (asymptotic running time will get more weightage) and accuracy of the model on test or train data in 2-3 slides.
2. Use any randomized scaling techniques taught in the class to scale up the training phase of your model. State reasons for the scaling method used and show a comparison of the test/train accuracy from a model trained on the smaller dataset vs a model trained on the actual dataset in 2-3 slides. The comparison must be similar to that of Q3 of the assignment.
3. Report the improvement in the training time after applying scaling methods in 1 slide (additional asymptotic comparisons will have higher weightage).
4. Conclusion and future work in 1 slide.

All the best!
